

Subject: Accessibility Features Added to Improve Website Usability

Dear John O'Reilly,

I hope you're doing well. I'm writing to let you know that I've implemented several accessibility improvements to your website to ensure it's more inclusive for all users, including those with colour blindness or visual impairments.

Here are the three key features I added:

Avoided using colour alone to convey information:

I ensured that all important content (such as buttons and section titles) includes both text and visual cues rather than relying on colour alone. This helps users who have difficulty distinguishing certain colours still understand all information.

Used high contrasting colours:

I chose strong colour contrasts for example, bright yellow boxes and white borders on a black background to make the text and design elements stand out clearly. This improves readability and ensures the site meets accessibility contrast guidelines.

Underlined or bolded important text:

Instead of using only colour to draw attention, key sections such as headings and buttons are bold and centrally aligned and important information has been underlined. This ensures users with limited colour perception can still identify important information quickly.

These changes help make the site easier to navigate and more visually accessible to all users. Please let me know if you'd like any further adjustments or additional accessibility testing.

Kind regards,
Web Designer
